Pembolehubah Latihan

- parameter atau perkara-perkara yang boleh diukur dan diubahsuai bagi memberikan respon dan kesan adaptasi yang diperlukan bagi setiap program latihan yang dibina (Goto et al., 2004; Toigo & Boutellier, 2006).

Pembolehubah Latihan	Definisi Umum
bebanan	Jumlah berat bebanan atau rintangan yang digunakan. Contoh berat badan sendiri 65kg atau berat dumbbell 40 kg (bebanan luar).
ulangan	Jumlah bilangan kontraksi penuh otot bagi setiap lakuan senaman latihan bebanan atau bilangan lakuan senaman dalam satu pergerakan lengkap.
set	Gabungan jumlah ulangan pergerakan atau kerja tanpa henti dalam setiap satu pergerakan atau aktiviti lengkap (tanpa masa rehat).
durasi masa rehat / pemulihan	Tempoh masa otot atau tubuh berhenti dari lakuan aktiviti bagi rehat dan pemulihan.
durasi masa kerja / senaman	Tempoh masa otot atau tubuh bekerja bagi setiap lakuan atau aktiviti (tempoh masa ransangan fisiologi dan mekanikal).
tempo pergerakan	Halaju setiap satu pergerakan lakuan
julat pergerakan	Sudut pergerakan lengkap setiap lakuan senaman
jenis senaman / pergerakan / lakuan	bentuk senaman / pergerakan / lakuan yang digunakan

Pembolehubah Latihan	Definisi Umum
arah rintangan	Merujuk kepada punca kedudukan rintangan / bebanan berbanding kedudukan asal otot / tubuh.
isipadu latihan	Merujuk kepada gabungan mana-mana pembolehubah utama yang digunakan bagi menunjukkan jumlah berat keseluruhan program latihan berkenaan. Sebagai contoh: <i>Isipadu latihan bebanan= set x ulangan x % 1RM</i>
intensiti latihan	Tahap kesukaran latihan. Sebagai contoh kadar nadi latihan yang ditetapkan bagi sesi berkenaan atau peratus bebanan yang perlu diangkat dalam sesi latihan bebanan berbanding kemampuan angkatan maksima.
frekuensi latihan	Kekerapan latihan dari segi kekerapan sesi setiap minggu atau bulan atau fasa.
durasi sesi latihan	Merujuk kepada keseluruhan durasi masa latihan bagi setiap sesi
jenis latihan	Bentuk latihan yang dipilih.

Kekerapan	Intensiti	Durasi Masa Latihan	Jenis Latihan
UNTUK KECERGASAN KARDIOVASKULAR DAN KOMPOSISI TUBUH			
3-5 hari seminggu	55 / 65 % - 90% Kadar Nadi Maksima	20-60 minit secara berterusan atau jeda, bergantung pada intensiti.	Apa sahaja aktiviti yang menggunakan otot-otot besar tubuh. Contohnya berlari, berbasikal, berenang dan tarian aerobic.
KEKUATAN DAN DAYA TAHAN OTOT, KOMPOSISI TUBUH DAN KELENTURAN			
2-3 kali seminggu	1 set atau lebih, 8-10 senaman otot besar, 8-10 ulangan.	Bergantung kepada set dan ulangan setiap sesi (~20-40 minit).	Latihan bebanan
2-3 kali seminggu	Julat pergerakan maksima selesa tanpa kesakitan setiap bahagian sendi otot.	10-30 saat setiap regangan.	Latihan kelenturan

Cadangan parameter latihan bagi tujuan kecergasan fizikal umum untuk kesihatan dikalangan populasi dewasa yang sihat tubuh badan dan tidak mempunyai sebarang masalah kecederaan atau kesakitan (Kraemer et al., 2002; Kraemer & Ratamess, 2004; Pollock et al., 1998)

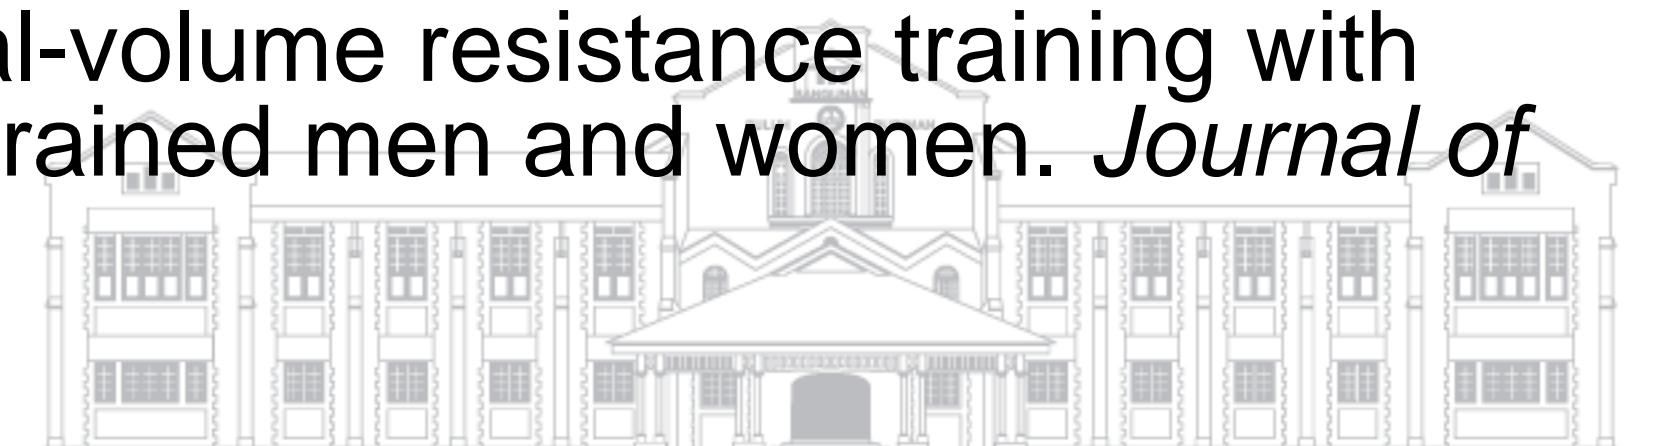

Kesimpulan

- Tujuan utama latihan suaian fizikal adalah untuk menyesuaikan fizikal seseorang individu mengikut keperluan mereka (kecergasan gaya hidup sihat, sukan prestasi tinggi, atau taktikal).
- Keperluan individu biasanya lebih mudah dibahagikan mengikut pembahagian komponen kecergasan.
- komponen kecergasan berteraskan kesihatan adalah teras utama dan perlu di latih terlebih dahulu
- Penting: Penyesuaian bolehubah mengikut ciri-ciri sistem tenaga yang diingini dan lengkuk daya-halaju dalam menentukan bolehubah prestasi
